MASTER MODEL • SEPTEMBER 2026

CFI 2.0

Strategic Framework & Master Model

Strategic identity, seven pillars, organizational architecture, project lifecycle and the ten-year roadmap — a unified impact-infrastructure model for Ghana and future expansion across Africa.

CORE PRINCIPLE

CFI does not only build infrastructure. CFI builds infrastructure that is **designed, financed, operated, maintained and measured** throughout its useful life.

HOW TO READ THIS

This is a strategic architecture, not an implementation manual. Parts I–II explain why CFI exists in this form and the capabilities it must build. Parts III–VI define how work is structured, approved, financed and governed. Parts VII–IX describe how CFI proves results, how it grows, and what it will and will not do.

THE STANDARD CFI HOLDS ITSELF TO

Success is not how many projects are built. Success is whether infrastructure continues to work, serves its intended users, is responsibly operated and maintained, and creates measurable value.

00 Executive Summary

CFI 2.0 restructures Clean Future International into a mission-driven international development and impact-infrastructure organization. CFI will initially operate in Ghana, while the architecture is designed to support responsible expansion across Africa.

The model combines community problem identification, evidence, engineering, capital mobilisation, infrastructure delivery, operations, maintenance, impact measurement, digital asset management and reinvestment into a single accountable chain. Construction is treated as one stage in that chain rather than as the end of the work.

This document sets out the strategic identity that justifies the model, the seven pillars that organize it, the architecture and lifecycle that operate it, the financial and governance controls that protect it, and the roadmap that sequences it over ten years.

CFI will not define success only by how many projects are built. CFI will define success by whether infrastructure continues to work, serves intended users, is responsibly operated and maintained, and creates measurable value.

How this document is organized

01

Strategic Identity

Clean Future International is a mission-driven international organization focused on solving practical community infrastructure problems.

CFI works at the point where community need, engineering, finance, implementation and long-term operations meet. The organization is designed to identify problems that affect the quality of everyday life, verify those problems with evidence, develop technically appropriate solutions, mobilize the resources required to deliver them, and establish the systems necessary to keep the resulting infrastructure functional.

CFI works with communities, technical professionals, local institutions, governments, businesses, donors, universities and development partners. It is not simply a fundraising organization, a construction company, an engineering consultancy or a technology platform — it integrates those capabilities around one mission.

THE DEFINING DISTINCTION

CFI does not define success as completing a construction project. Success is a functioning asset that continues to deliver value to its intended community.

What this rules out

A facility that is constructed but poorly maintained is not a successful CFI project.

A water system that stops working after six months is not a successful CFI project.

A sanitation facility without a realistic operating model is not a complete solution.

CFI's responsibility extends beyond construction into commissioning, operations, maintenance, measurement and continuous improvement. Every structural decision in this document follows from that single commitment.

02

The Problem CFI Exists to Solve

Across many communities, infrastructure problems are not caused simply by a lack of money.

They are also caused by weaknesses in how projects are defined, designed, procured, owned, operated and monitored. Money solves only one of those. CFI is structured to address all of them, because any single unaddressed weakness is enough to end an asset's working life early.

Twelve recurring causes of infrastructure failure

The cycle CFI is designed to interrupt

THE RECURRING CYCLE

THE CFI LIFECYCLE

Before funding

Evidence replaces assumption, and an inappropriate design is caught by review rather than by failure.

During delivery

Procurement, supervision and commissioning are documented, so what was designed is what enters service.

After handover

A named operator, a funded maintenance plan and monitored functionality keep the asset alive.

03 Vision

VISION STATEMENT

A future in which every community can access reliable, sustainable and well-managed infrastructure that improves lives and strengthens local development.

The vision is deliberately broader than individual infrastructure projects. CFI is working toward communities where essential infrastructure is available, appropriate, functional, maintainable, financially responsible and sustainable.

Available

Appropriate

Functional

Maintainable

Financially responsible

Sustainable

04 Mission

CFI identifies, develops and delivers sustainable community infrastructure by combining local knowledge, technical expertise, responsible capital and long-term operating systems.

Five fundamental responsibilities

01

Understand the problem

CFI listens to communities and establishes what is actually needed.

02

Engineer the solution

CFI converts verified needs into technically appropriate, context-specific infrastructure.

03

Mobilize the capital

Grants, donations, institutional funding, CSR, public programmes, partnerships and appropriate earned income.

04

Deliver and sustain

CFI oversees delivery and establishes the operating and maintenance arrangements after construction.

05

Measure and improve

CFI tracks whether infrastructure works, what it costs, who benefits and what can be replicated.

05

Strategic Positioning

CFI occupies a distinctive position between four conventional models. Each of those models is strong in part of the chain; none of them is accountable for the whole of it.

MODEL	TYPICALLY STRONG IN	TYPICAL LIMITATION
Traditional NGO	Community engagement and social programmes	May lack deep infrastructure development, engineering, asset management or long-term operating capability.
Engineering organization	Technical design and construction	May not be structured around community development, blended funding or long-term social impact.
Development funder	Capital allocation and grants	May not directly control the technical and operational lifecycle of the assets it finances.
Donation platform	Connecting donors with projects	Generally does not assume responsibility for designing, constructing and maintaining the infrastructure.

What CFI integrates

THE CENTRAL STRATEGIC PROPOSITION

CFI does not simply fund infrastructure. CFI develops infrastructure systems that are designed to function.

06

CFI's Strategic Promise

Every CFI project must answer six questions. Together they form the CFI Project Test — the strategic statement of the same discipline that the twelve approval gates enforce operationally.

The test is applied first at the point a problem is proposed as a project, and again whenever the answer to any question materially changes. A project that once passed does not stay passed: a withdrawn operator, a failed water source or a lost permission returns the project to the test.

1

Is the problem real?

There must be evidence — not assumption, request volume or anecdote.

2

Is the proposed solution appropriate?

The technical solution must fit the community, environment and operating conditions.

3

Can the solution actually be delivered?

Land, permissions, procurement, contractors, funding and technical capacity must be considered.

4

Can the asset function after completion?

Operations, staffing, utilities, cleaning, repairs and maintenance must be planned.

5

Can CFI demonstrate the impact?

The organization must be able to show what changed, with a baseline to compare against.

6

Can the model be improved or replicated?

Every project should generate institutional knowledge, not just a completed asset.

Six questions, twelve gates. The Project Test is how CFI decides whether to begin. The approval gates in Part IV are how CFI decides whether to continue — the same six questions, asked repeatedly and formally as a project moves through its lifecycle.

07

Theory of Change

CFI's theory of change is straightforward: verified need, appropriate solution, mobilized capital, delivered infrastructure and sustained operation together produce outcomes that can be measured — and the measurement improves the next project.

THE PROBLEM

Communities experience infrastructure deficits that affect health, education, economic activity, safety, dignity and environmental conditions.

THE INTERVENTION

CFI identifies and verifies infrastructure problems, develops appropriate solutions, mobilizes capital, delivers infrastructure and establishes sustainable operating systems.

IMMEDIATE OUTPUTS

Infrastructure that is technically appropriate, accessible, functional, documented, commissioned, operated and maintained.

SHORT- AND MEDIUM-TERM OUTCOMES

Better access to essential services; improved health and hygiene; improved educational environments; greater safety and dignity; reduced environmental impacts; increased community resilience; stronger local capacity; improved economic opportunity where relevant.

LONG-TERM IMPACT

Communities become better equipped to support healthier lives, stronger local economies and more resilient development.

Institutional learning — the feedback loop

CFI measures the performance of each intervention and uses the evidence to improve designs, operating models, financing structures and future projects.

This feedback loop is one of the most important elements of the CFI model.

08 The CFI Strategic Equation

The organization expresses its strategy through one equation and one lifecycle. The equation states what must be present; the lifecycle states the order in which it must happen.

THE ORGANIZATIONAL LIFECYCLE

Twelve stages — the CFI operating philosophy, not a project workflow

09 What CFI Will Ultimately Become

The long-term ambition is for CFI to evolve into a community infrastructure development platform with institutional capability across the entire asset lifecycle: **identify, assess, design, finance, procure, build, commission, operate, maintain, measure, improve, replicate.**

Rather than becoming dependent on a series of disconnected projects, CFI builds a repeatable infrastructure development system. **That system becomes the organization's principal institutional asset.**

10 The Seven Strategic Pillars

The identity in Part I becomes operational through seven pillars. Each pillar has a single accountable owner, a defined capability to build and a maturity marker that shows whether it is working. No pillar can carry the model alone; a weakness in one appears as failure in another.

The pillars are not a second organizational chart. They describe **capability** — what CFI must be able to do — while the divisions in Part III describe **accountability** for doing it, and the approval gates in Part IV describe the **evidence** that it was done.

CAPABILITY — THE PILLAR	What CFI must be able to do (Part II)
ACCOUNTABILITY — THE DIVISION	Who is answerable for doing it (Part III)
EVIDENCE — THE GATE	Proof that it was done, before the project continues (Part IV)

How to read the pillars. Pillars 1–3 determine whether the right thing gets built. Pillars 4–5 determine whether it keeps working. Pillars 6–7 determine whether CFI can prove it and do it again somewhere else.

SECTION 10 CONTINUED

Pillars 1–4 • Building the Right Thing

1 Community & Need

Owner — CFI Community

Must guarantee: no project begins without a problem that has been named by the community and verified independently.

CAPABILITIES TO BUILD

Needs assessment method, stakeholder mapping, community participation and safeguarding practice, local partnership agreements, baseline data collection.

MATURITY MARKER

A Community Registry of verified needs that is used to select projects — not a list assembled after a project has already been chosen.

2 Engineering & Innovation

Owner — CFI Engineering

Must guarantee: every design is appropriate to its users, site, environment, operating conditions and maintenance reality.

CAPABILITIES TO BUILD

A CFI technical standards library, independent peer design review, appropriate-technology selection, design-for-maintenance discipline, quantity surveying and technical QA.

MATURITY MARKER

Standard design packages that can be adapted to a new site in weeks rather than redesigned from scratch, each with a maintenance specification attached.

3 Infrastructure Delivery

Owner — CFI Delivery

Must guarantee: what was designed is what gets built, procured transparently and commissioned properly.

CAPABILITIES TO BUILD

Procurement policy and supplier due diligence, contract management, site supervision, quality control, defects management, commissioning and handover documentation, operator training.

MATURITY MARKER

A complete, auditable delivery file for every project — and no asset entering service without a signed commissioning record.

4 Sustainable Finance

Owner — CFI Capital

Must guarantee: every project is funded for its life, not only for its construction.

CAPABILITIES TO BUILD

Blended capital strategy, lifecycle costing, restricted-fund control and project coding, revenue validation, maintenance reserves, donor and institutional reporting.

MATURITY MARKER

Every approved project carries a funded operating and maintenance plan and a named reserve before construction begins.

SECTION 10 CONTINUED

Pillars 5–7 • Keeping It Working and Proving It

5 Operations & Asset Management

Owner — CFI Operations

Must guarantee: every asset has a named operator, a funded maintenance routine and a record of its condition.

CAPABILITIES TO BUILD

Operating models and operator agreements, service standards, planned and corrective maintenance, spares and consumables supply, utilities management, complaints handling, the Asset Registry.

MATURITY MARKER

Asset functionality and repair-response time are reported routinely — and an asset that stops working is detected by CFI before it is reported by the community.

6 Impact, Data & Learning

Owner — CFI Impact & Digital

Must guarantee: CFI can show what changed, what it cost and what should be done differently next time.

CAPABILITIES TO BUILD

Baseline and follow-up measurement, the five connected registries, the Project Passport, functionality monitoring, evaluation method, structured lessons and selective public transparency.

MATURITY MARKER

Design and operating decisions on a new project can be traced to evidence from a previous one.

7 Institutional Strength & African Scale

Owner — Board and shared functions

Must guarantee: CFI remains governable, compliant and credible as it grows — and enters a new country only when it is ready.

CAPABILITIES TO BUILD

Governance and audit, safeguarding, risk management, financial controls and segregation of duties, legal and regulatory readiness, talent and local leadership, partnerships, country-entry assessment.

MATURITY MARKER

A documented country-entry standard exists, and CFI can demonstrate it was met before any new jurisdiction was opened.

PILLAR DISCIPLINE

A pillar is not a department and not a slogan. It is a capability CFI either has or does not have — and each one is assessed at the Year 1, Year 3, Year 5 and Year 10 horizons in Part VIII.

11

CFI 2.0 Organizational Architecture

CFI operates as one integrated organization with six specialist divisions around a single mission core, supported by shared institutional functions.

No division delivers a project alone. Each hands work forward through the lifecycle and is answerable at the approval gate that closes its stage.

Six divisions, one chain of custody. A verified community problem passes from Community to Engineering, Capital, Delivery and Operations — and returns as evidence through Impact & Digital.

SECTION 11 CONTINUED

The Six CFI Divisions

11.1 CFI Community

Discovers and understands problems through needs assessments, stakeholder engagement, local partnerships, social assessment, community participation and capacity building.

Principle: community before solution.

11.2 CFI Engineering

The technical heart of the organization: architecture, civil and structural engineering, water and sanitation, electrical and renewable energy, environmental considerations, quantity surveying and technical quality assurance.

11.3 CFI Capital

Connects verified projects with appropriate funding: donations, grants, foundations, CSR, institutional partners, government programmes, major donors, in-kind contributions and, where appropriate, impact-oriented capital and earned income.

11.4 CFI Delivery

Manages procurement, contracting, construction, quality control, technical supervision, documentation and commissioning.

11.5 CFI Operations

Establishes responsibility for operating, cleaning, utilities, routine maintenance, repairs, service quality, complaints handling and operational records.

11.6 CFI Impact & Digital

Measures outcomes and maintains the digital operating layer connecting community evidence, projects, funding, assets, operations, maintenance and impact.

How the divisions hand work forward

12 The CFI Project Lifecycle

Every CFI project follows the same twelve stages.

The lifecycle is a loop rather than a line: what is measured and learned at the end determines what is discovered and funded next. Stages are not optional and cannot be reordered — a project that skips a stage has not saved time, it has moved an unanswered question further downstream.

STAGES 1-3 • DEFINE

Establish that the problem is real, verified and solvable before anything is designed.

STAGES 4-6 • DELIVER

Fund, build and commission with documented controls and trained operators.

STAGES 7-12 • SUSTAIN

Operate, maintain, measure and reinvest — then replicate only where evidence supports it.

SECTION 12 CONTINUED

What Happens at Each Stage

12.1

Discover

CFI begins with the problem rather than a predetermined solution.

12.2

Verify

Reported needs are verified through site visits, interviews, technical inspections, available data and stakeholder evidence.

12.3

Design

CFI develops an appropriate solution based on users, site, environment, operating conditions and lifecycle requirements.

12.4

Fund

The project must have a credible capital plan and an operating and maintenance plan **before** construction approval.

12.5

Build

Construction uses documented procurement, contracts, technical supervision, quality control and financial controls.

12.6

Commission

Infrastructure is tested, defects are addressed, documentation is completed and operators are trained before service begins.

12.7

Operate and Maintain

The asset enters a defined operating model with responsibilities, budgets, inspections, routine maintenance and corrective repairs.

12.8

Measure, Learn and Scale

CFI measures functionality, cost, user experience, impact and sustainability. Replication follows evidence, not enthusiasm.

The handover test. A CFI project is not complete when the building is finished. It is complete when a named operator, a funded maintenance plan and a measurement routine are all in place and working.

13 Project Approval Gates

Twelve gates sit across the lifecycle. Each is a single question that must be answered affirmatively, with evidence, before a project may proceed. A gate that cannot be passed is not a delay — it is the model working.

GATES 0-5 • PROBLEM TO DESIGN

0	Problem	Is there a meaningful problem?
1	Evidence	Has the need been sufficiently verified?
2	Feasibility	Can it be solved technically, legally and socially?
3	Sustainability	Can the asset be operated and maintained?
4	Finance	Is there sufficient capital and a credible OPEX plan?
5	Design	Has the technical package been reviewed?

GATES 6-11 • DELIVERY TO SCALE

6	Procurement	Is procurement transparent and controlled?
7	Construction	Are quality and progress controlled?
8	Commissioning	Does the infrastructure actually work?
9	Operations	Is a responsible operator and an O&M system in place?
10	Impact	Is the intended result being achieved?
11	Scale	Is there sufficient evidence to replicate?

GATE 0

GATE 11

Discover · Verify · Design

Fund · Build · Commission

Operate · Measure · Scale

GATE DISCIPLINE

Gates 3 and 4 are the gates most development projects skip. CFI treats them as mandatory: no construction approval without a named operator and a funded operating plan.

14

CFI Hybrid Financial Model

CFI will combine philanthropic and development capital with appropriate forms of earned income. The commercial component exists to protect assets, reduce unnecessary dependency on donations, maintain affordability and create additional impact.

HOW MONEY MOVES THROUGH AN ASSET

The commercial component is a protective mechanism, not a profit motive.

It exists to fund maintenance and reserves, reduce dependency on repeat appeals, keep services affordable and extend the working life of every asset.

SECTION 14.1

Three Project Sustainability Categories

Every CFI project is classified before funding. The category determines what evidence is required, what revenue may be assumed and how the operating deficit — if any — will be covered.

SECTION 14.2

Lifecycle Costing

Every project considers capital expenditure, operating expenditure, routine and corrective maintenance, asset renewal, contingency and other relevant lifecycle costs. **Construction cost alone is not a sustainability plan.**

Contingency and risk allowance sit across all four.

SECTION 14.3

Revenue Sources

Where appropriate and legally permissible, CFI may use user fees, facility-related commercial activity, kiosk rental, sponsorship, advertising, CSR support, grants or other mission-aligned income. **Revenue assumptions must be validated before inclusion in a final investment case.**

Revenue is treated as a way to protect the asset and reduce dependency on repeat appeals — never as a reason to build something the community did not need. Where a revenue assumption fails in practice, the project's sustainability category is revised rather than defended.

SECTION 14.4

Financial Controls

CFI will separate restricted project funding, unrestricted donations, grants, sponsorship, earned income and other capital categories. Every project will have a unique financial code so receipts, invoices, payments, procurement and reporting can be traced.

Restricted funds Ring-fenced to purpose	Unrestricted funds Core and contingency	Earned income Accounted separately	Project code One traceable ledger
---	---	--	---

15

Asset Management

CFI will treat infrastructure as an asset with a lifecycle, not as a one-time project. Each major asset carries a permanent record maintained for its working life.

ASSET RECORD — WHAT CFI HOLDS FOR EVERY MAJOR ASSET			
• Asset ID	• Location	• Commissioning date	• Capital value
• Expected useful life	• Responsible operator	• Maintenance schedule	• Condition
• Repair history	• Operating cost	• Revenue (where applicable)	• Replacement need
An asset without a named operator and a maintenance schedule is an unmanaged liability.			

16

CFI Impact & Asset Management System

The digital platform concept is absorbed into CFI rather than operated as a separate organization or brand. It becomes CFI's internal operating layer for project, asset, financial and impact information.

Building it internally is a deliberate choice: the value is in the records CFI keeps about its own assets, not in a product. The system stays proportionate to the portfolio it serves and grows only as the portfolio does — CFI will not build a large technology platform before the operating model it is meant to serve has been proven.

SECTION 16.1

The CFI Project Passport

Every major project receives a unique Project ID. The Project Passport is the single record that follows it from first assessment to replacement.

CFI PROJECT PASSPORT			PROJECT ID • 001
ORIGIN	DELIVERY	LIFETIME	
Problem statement	Budget	Operating cost	
Evidence and verification	Funding sources	Maintenance	
Beneficiaries	Procurement record	Revenue	
Site information	Construction record	Reserves	
Technical assessment	Commissioning	Impact and inspections	
Design	Named operator	Risks and history	

One project, one record. The Passport is what makes transparency, audit, maintenance planning and impact reporting possible without rebuilding the story from scratch each time.

SECTION 16.2

Five Connected Data Systems

Five registries hold CFI's operating memory. Each feeds the next, and together they allow any claim CFI makes to be traced back to a record.

- 01

Community Registry
Verified needs, assessments and stakeholder evidence.
- 02

Project Registry
Projects from discovery through delivery.
- 03

Asset Registry
Physical infrastructure after commissioning.
- 04

Financial Registry
Sources and uses of funds, traceable by project code.
- 05

Impact Registry
Outcomes, functionality, users and learning.

SECTION 16.3

Public Transparency

At maturity, CFI may publish selected project information through an Impact Map or donor dashboard, while protecting privacy, safeguarding and sensitive information. Transparency is a control, not a marketing channel.

17 Governance, Audit and Risk

17.1 Governance

The Board provides strategic oversight. Audit and Risk provides independent oversight of financial controls, risk and compliance. Management is responsible for implementation.

17.2 Segregation of Duties

No single person should independently control the full chain of design, contractor selection, procurement approval, payment and completion certification.

17.3 Core Controls

CFI will establish institutional banking, approval limits, dual authorization where appropriate, procurement documentation, supplier due diligence, conflict-of-interest controls, contracts, invoices, payment approvals, bank reconciliation, project accounting, restricted-fund tracking, asset records and financial reporting.

17.4 Risk Management

Projects will be risk-rated and monitored for land and ownership, technical failure, contractor performance, financial leakage, corruption, safeguarding, environmental harm, political or community conflict, sanctions and cross-border fund movement.

17.5 Safeguarding

Safeguarding standards will cover children, vulnerable adults, community engagement, staff, volunteers and project sites, and will be integrated into project design and implementation.

18 UK Registration and Ghana Operations

CFI is currently registered in the United Kingdom and intends to operate initially in Ghana. CFI will distinguish its UK legal identity from the regulatory permissions and operating arrangements required in Ghana.

What must be confirmed in Ghana

Sequence before substantial operations

Each step must be evidenced before the next begins.

A statement CFI holds itself to. CFI will not describe itself as an already-established Ghanaian entity unless that legal status has actually been obtained.

CFI WASH — First Programme

CFI's first major programme will focus on Water, Sanitation and Hygiene, building on CFI's original purpose and the documented need in Ghana.

WASH is a deliberate starting point rather than a preference. The need is documented, the engineering is within CFI's competence, the assets are small enough to be operated and maintained credibly at an early stage, and functionality can be measured honestly — which makes it the right sector in which to prove a lifecycle model.

School WASH

Facilities where children learn

Community sanitation

Shared and public facilities

Water systems

Supply, storage and hygiene

Sanitation waste

Wastewater and sludge handling

SECTION 19.1

The CFI Sustainable Sanitation Hub

Depending on location, a Hub may combine the components below. The final design will always be site-specific.

20

Professional and Community Networks

CFI's capacity is deliberately wider than its payroll. Two networks extend it: one technical, one local. Neither replaces accountable staff — both make better decisions possible.

Interdisciplinary professional network

Engineers, architects, quantity surveyors, environmental specialists, water professionals, energy specialists, project managers, finance professionals, technology professionals, researchers, students and communications specialists — supporting technical review, research, mentoring, training and project development.

Local community network

Community leaders, schools, youth, women's groups, local businesses, artisans, operators, local government, local NGOs and other relevant institutions — the people who make an asset work after the contractor leaves.

21

Sustainability Framework

Five dimensions, five questions. A project is sustainable only when all five can be answered — a project strong on four and silent on the fifth is not sustainable, it is exposed.

DIMENSION	CORE QUESTION
Technical	Does the infrastructure continue to work?
Financial	Can operating and maintenance costs realistically be covered?
Institutional	Is responsibility clearly assigned?
Social	Do people use, support and help sustain the solution?
Environmental	Can it operate without unacceptable environmental harm?

22 Measurement and Impact

CFI will measure functionality and service quality rather than only construction outputs. Every project carries a baseline taken before work begins, so that later claims have something to be compared against.

Asset performance

Functionality, uptime, repair-response time, water availability, cleanliness.

Financial health

Operating-cost recovery, maintenance-reserve adequacy.

People and place

Accessibility, beneficiaries served, user satisfaction, environmental and social outcomes.

An indicator is only useful if someone acts on it. Each measure has a named owner, a reporting frequency and a threshold at which it triggers a response — a repair, a design change, a funding decision or a review of the operating model.

23 CFI Scaling Strategy

Ghana will be the first operating environment in which CFI proves its model. Expansion into other African countries will be based on evidence, organizational capacity, legal readiness, partner quality, funding and risk assessment.

GHANA FIRST — EVIDENCE BEFORE EXPANSION

No country is added because an opportunity appears. A country is added because the model is proven, the organization has the capacity to manage it, and the legal, partner and funding conditions have been assessed and met.

24 Initial 24-Month Roadmap

The first two years establish the institution, prove the lifecycle on a single project and generate the evidence needed to decide whether and where to replicate.

These twenty-four months sit inside Year 1 of the ten-year roadmap in Section 25. They are described in more operational detail here because they are the only period in which CFI's plans do not depend on evidence it has yet to generate.

0-3

MONTHS

Establish the institution

Finalize governance, legal review, financial controls, safeguarding, procurement, technical standards, the WASH programme and digital requirements.

3-6

MONTHS

Select and prepare Project 001

Complete baseline, community assessment, technical feasibility, lifecycle costing, design and funding plan.

6-12

MONTHS

Deliver and commission

Procure, construct, commission and establish operations and maintenance systems.

12-24

MONTHS

Operate, measure and decide

Monitor functionality, costs, revenue where applicable, maintenance, user experience and impact; document lessons and decide on replication.

THE POINT OF YEAR ONE

Year one is not about how many projects CFI starts. It is about whether the first one can be operated, maintained, financed and measured well enough to justify the second.

25 The CFI Ten-Year Roadmap

Four horizons, each defined by capability rather than by date. The figures below are **planning assumptions, not commitments** — deliberately conservative, and revised against evidence at each horizon. CFI moves to the next horizon when the conditions on the following page are met, not when the calendar allows it.

YEAR 1

PROVE

Build the institution and deliver Project 001.

Governance, financial controls, safeguarding, procurement and technical standards in place. The Ghana regulatory position confirmed. One WASH project selected from verified need, designed, funded, built, commissioned and handed to a named operator with a funded maintenance plan. The Community, Project, Asset, Financial and Impact registries opened.

~1	1	1
asset in service	programme (WASH)	country (Ghana)

YEAR 3

REPEAT

Turn one project into a method.

Three to five completed projects in Ghana, all operating and monitored. First standard design packages published with maintenance specifications. First independent evaluation completed and its findings visible in the next design. Maintenance reserves funded and tested by real repairs. Ghana operating entity and local team established.

3–5	v1	1st
assets in service	standard designs	external evaluation

YEAR 5

SYSTEMATIZE

Run a country programme, not a series of projects.

Ten to twenty assets under management with reported functionality and cost data. Operating model proven across more than one asset type. Earned-income components tested honestly and reported. Ghana-led team with local leadership. A documented country-entry standard, and a formal assessment of a second country — entry only if the standard is met.

10–20	2	1
assets managed	programme areas	country assessed

YEAR 10

SCALE

Become an infrastructure development platform.

Operating in two to four African countries with a shared standards library, shared registries and locally led delivery. A portfolio of assets whose functionality, cost and impact can be reported at portfolio level. The repeatable development system — not any single asset — recognized as CFI's principal institutional asset.

2–4	Portfolio	System
countries	level reporting	as the asset

SECTION 25 CONTINUED

Pillar Maturity Across the Horizons

Each pillar matures at its own pace. The table states what "working" looks like for each pillar at each horizon, so progress can be assessed honestly rather than declared.

PILLAR	YEAR 1	YEAR 3	YEAR 5	YEAR 10
1 • Community & Need	Method defined; first registry entries	Registry drives project selection	Community partnership model standardised	Locally led in every country
2 • Engineering	Standards drafted; peer review in place	Design packages v1 published	Library covers main asset types	Shared library across countries
3 • Delivery	Procurement policy live; one project delivered	Auditable delivery file every time	Multiple contractors managed to standard	Delivery capability transferable
4 • Finance	Controls and project coding operating	Reserves funded and tested	Blended model proven; revenue validated	Portfolio-level financial management
5 • Operations	One named operator; O&M plan funded	Functionality reported routinely	Operating model proven across asset types	Asset management at portfolio scale
6 • Impact & Data	Baselines captured; registries opened	First independent evaluation	Evidence changes design decisions	Public portfolio reporting
7 • Institutional	Governance, safeguarding, risk established	Ghana entity and local team	Country-entry standard documented	Multi-country governance sustained

Conditions for moving to the next horizon

Year 1 → Year 3

Project 001 is functioning twelve months after commissioning, its operating costs are known and covered, and its lessons are documented.

Year 3 → Year 5

The method has been repeated at least three times with comparable results, and maintenance reserves have survived real repairs.

Year 5 → Year 10

The country-entry standard is documented and met, local leadership is in place, and portfolio reporting is credible to an external reviewer.

A deliberate constraint. If a horizon's conditions are not met, CFI stays at that horizon and improves. Growing on schedule while the previous horizon is still failing is the exact pattern this model exists to avoid.

26

CFI's Eight Operating Principles

Eight rules of sequence. Each names what must come first.

They are written as pairs because almost every failure this model is designed to prevent comes from doing the second thing before the first — building before engineering, opening before planning maintenance, claiming impact before measuring it.

1 Community before solution

CFI understands the problem before selecting an intervention.

2 Engineering before construction

CFI develops an appropriate technical solution before building.

3 Lifecycle before opening day

CFI plans for operations, maintenance and renewal from the beginning.

4 Local ownership before dependency

CFI builds local capacity and responsibility.

5 Transparency before fundraising

CFI protects donor and public confidence through traceable systems.

6 Evidence before impact claims

CFI measures outcomes rather than relying on publicity.

7 Sustainability before short-term visibility

CFI prioritizes long-term service delivery over launch-day appearance.

8 Proven models before scale

CFI replicates what evidence shows can work.

The principles apply to decisions, not to documents. In practice each one is tested at an approval gate, where a project either has the earlier half in place or does not proceed.

Each principle is a sequencing rule, not a slogan. Where a project cannot satisfy the earlier half of a principle, it does not proceed to the later half.

27

What CFI Will Not Do

A model is defined as much by its refusals as by its ambitions. These are commitments, not preferences.

Each refusal has a matching control elsewhere in this document: an approval gate, a financial rule, a governance requirement or a measurement obligation. A refusal without a control is only an intention.

- CFI will **not** build first and solve maintenance later.
- CFI will **not** assume donor funding will permanently cover operating costs.
- CFI will **not** assume user fees automatically make infrastructure profitable.
- CFI will **not** build a large technology platform before proving the operating model.
- CFI will **not** launch multiple sectors without the capacity to manage them.
- CFI will **not** treat construction completion as proof of impact.
- CFI will **not** accept weak segregation of duties simply because a project is small.
- CFI will **not** describe a project as sustainable without evidence.

The list is deliberately short and specific. A long list of vague commitments is easy to sign and impossible to enforce; eight concrete refusals can be checked against an actual decision by an actual person on an actual project.

Why this list exists. Each item describes a decision that is easy to make under pressure — a deadline, a funding window, a photograph. Writing them down in advance is what makes them refusable later.

28 The CFI Master Formula

The whole model in one line: each element depends on the one before it, and the last returns to the first.

29 Final CFI Identity

CFI is a mission-driven impact-infrastructure organization designed to move from identifying a community problem to understanding it, engineering a solution, financing it, building it, operating it, maintaining it, measuring it and scaling what works.

CFI's long-term ambition is to become a respected Africa-focused international organization known for technical quality, responsible finance, local partnership, reliable infrastructure, transparency, sustainability and measurable impact.

That reputation will not be claimed. It will be the accumulated result of assets that still work, accounts that can be traced, communities that still use what was built, and evidence that any reasonable reviewer can check.

**CFI — Engineering better futures.
Sustaining them.**

CLEAN FUTURE INTERNATIONAL

CFI 2.0 Strategic Framework

This document is a strategic architecture, not an implementation manual. Legal, tax, engineering and regulatory implementation details require project- and jurisdiction-specific professional review before execution. Figures in the ten-year roadmap are planning assumptions to be revised against evidence, not commitments.

Document control. CFI 2.0 — Strategic Framework & Master Model. Issued September 2026. Clean Future International, registered in the United Kingdom, operating initially in Ghana. Sections 01–29, Parts I–IX.
